

March 8, 2009

Most of you receiving this e-mail know that I had (past tense) **prostate cancer**. That's not unusual as many, if not most men, will get diagnosed with prostate cancer especially now that ways to discover it are so good.

There are many ways to treat prostate cancer and I've looked at most thoroughly. All treatment methods will generally cure prostate cancer, but most cures can leave a patient with serious **ED or urinary control problems** and perhaps a few other problems as well.

What I learned in Dallas was that prostate cancer is a huge business and that many doctors are part of networks that offer most of the likely treatments. What I also learned is that when any of the doctors I talked with describe possible treatments that none will mention what may well be the magic bullet – **proton radiation**. Why, because they or their network can not offer that treatment. Hey it's a business! Proton radiation is a cancer killing treatment with no side effects or for that matter pain at all.

The only criticism of proton radiation is the cost, but Medicare pays for it and that is a good argument for other companies to pay for it as well. The reason that cities as large as Dallas do not offer proton radiation is that the cost of building a facility is around \$125 million. There are several places to go in the USA but the big two that really know what they are doing are Loma Linda in California and M. D. Anderson in Houston. Loma Linda has over 15 years experience and M. D. Anderson has a 2 year old state-of-the-art facility and it is the leading cancer facility in the world.

If you or any of your friends are diagnosed with prostate cancer send them to protonpals.net. If you click "My Journey-Ban" you will read my story of talking to numerous doctors and how my successful treatment went. If you click "Slide Show" you will see pictures of everything I went through.

Feel free to forward this to your friends as this treatment method is that good!

Stay healthy!
